- ▶ 1. Context, existing approaches & motivations
- 2. ModHel'X: underlying concepts
- 3. The coffee machine example
- 4. Discussion & conclusion

■ Context

- ▶ Heterogeneous systems: software/hardware, digital/analog, IPs...
- ▶ Multiple modeling formalisms: level of refinement, aspect, domain...

■ Context

- ▶ Heterogeneous systems: software/hardware, digital/analog, IPs...
- ▶ Multiple modeling formalisms: level of refinement, aspect, domain...

Global reasoning is impossible!

■ Context

- ▶ Heterogeneous systems: software/hardware, digital/analog, IPs...
- ▶ Multiple modeling formalisms: level of refinement, aspect, domain...

Global reasoning is impossible!

Multi-formalism modeling =
allow the use of **several modeling languages in a model**

- Objective: having a **global model** of the designed system
all along the design cycle
 - ▶ Design, test, verification, validation, ...

■ Context

- ▶ Heterogeneous systems: software/hardware, digital/analog, IPs...
- ▶ Multiple modeling formalisms: level of refinement, aspect, domain...

Global reasoning is impossible!

Multi-formalism modeling =
allow the use of **several modeling languages in a model**

■ Objective: having a global model of the designed system all along the design cycle

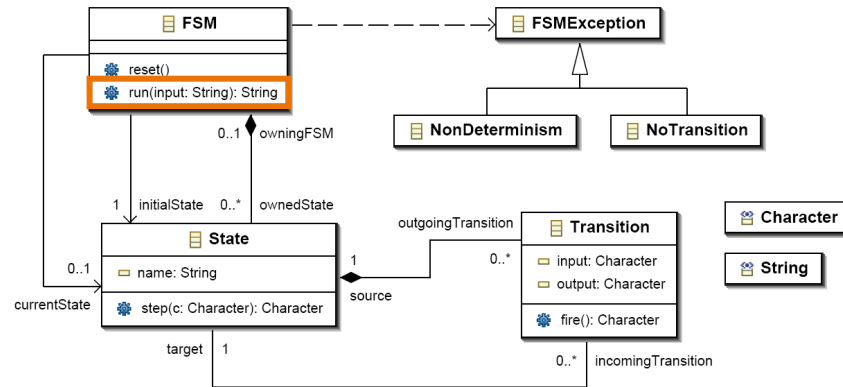

- ▶ Design, test, verification, validation, ...

■ Main issues

1. Describe **the semantics of a modeling language** precisely (executable)
2. Define **the semantics of a combination of modeling languages** in a model

1. Defining the semantics of modeling languages

[Kermeta] ▶ Ad-hoc meta-model + execution operations (imperative semantics)

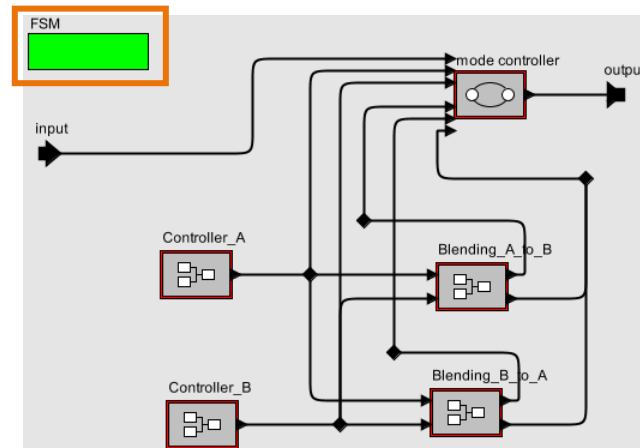

1. Defining the semantics of modeling languages

[Kermeta] ▶ Ad-hoc meta-model + execution operations (imperative semantics)

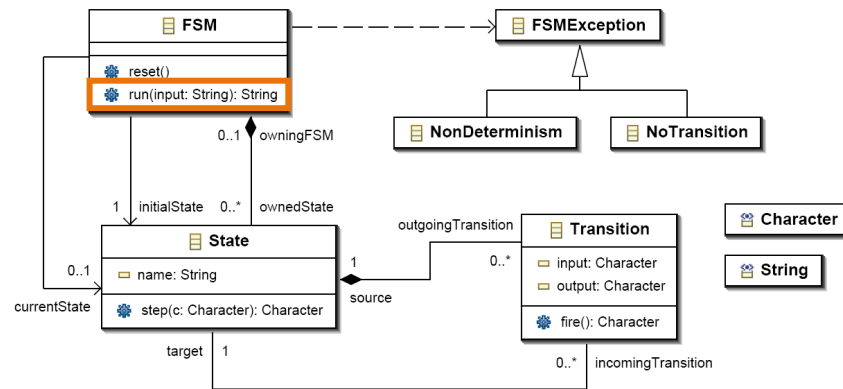

[PtolemyII] ▶ Fixed component-oriented abstract syntax
+ Model of Computation (MoC)

1. Defining the semantics of modeling languages

[Kermeta] ▶ Ad-hoc meta-model + execution operations (imperative semantics)

[PtolemyII] ▶ Fixed component-oriented abstract syntax
+ Model of Computation (MoC)

Set of rules that define the behavior of the model
by combining the behaviors of its components
= “way of interpreting the model”

1. Defining the semantics of modeling languages

[Kermeta] ▶ Ad-hoc meta-model + execution operations (imperative semantics)

[PtolemyII] ▶ Fixed component-oriented abstract syntax
+ Model of Computation (MoC)

How to “glue” heterogeneous parts together in a model?

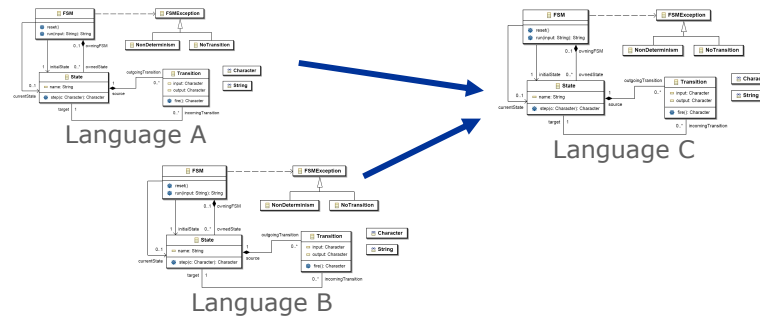

2. Combining modeling languages in a model
 - ▶ Transformation toward a union meta-model

2. Combining modeling languages in a model

- ▶ Transformation toward a union meta-model

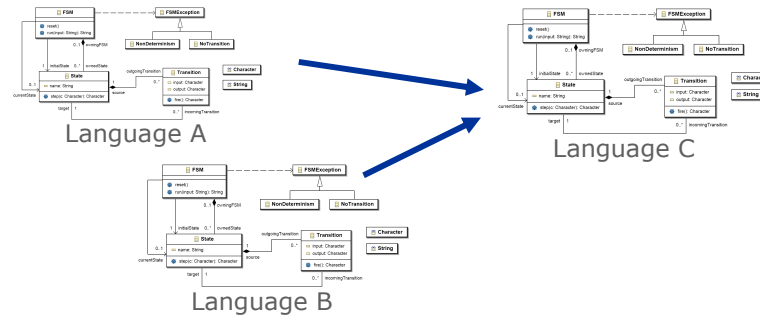

[ATOM³] ▶ Transformation toward one of the modeling languages

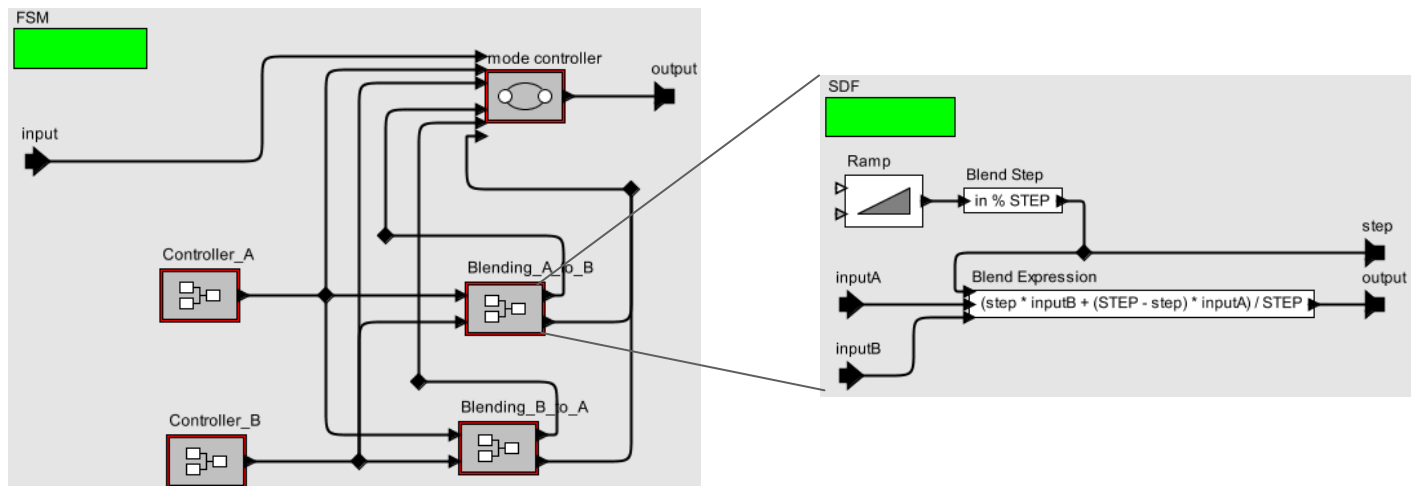

2. Combining modeling languages in a model

- ▶ Transformation toward a union meta-model

[ATOM³] ▶ Transformation toward one of the modeling languages

[PtolemyII] ▶ Hierarchical layers using different Models of Computation (MoCs)

2. Combining modeling languages in a model

- ▶ Transformation toward a union meta-model

[ATOM³] ▶ Transformation toward one of the modeling languages

[PtolemyII] ▶ Hierarchical layers using different Models of Computation (MoCs)

Issue: predefined & implicit glue between layers

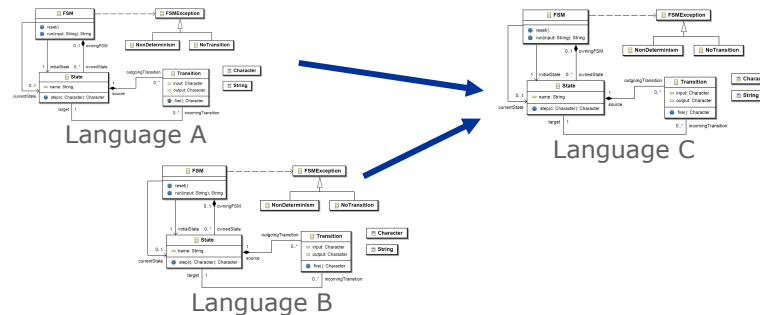

Modification of the models
in order to obtain an adapted glue

2. Combining modeling languages in a model

- ▶ Transformation toward a union meta-model

[ATOM³] ▶ Transformation toward one of the modeling languages

[PtolemyII] ▶ Hierarchical layers using different Models of Computation (MoCs)

Issue: predefined & implicit glue between layers

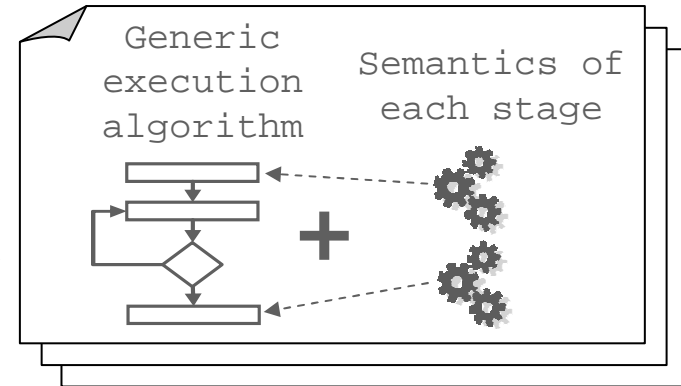

Modification of the models
in order to obtain an adapted glue

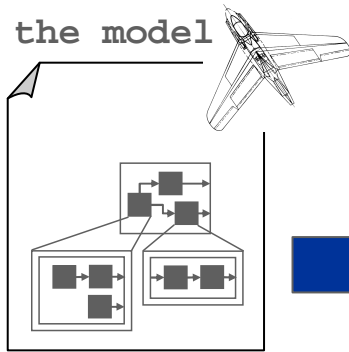

ModHel'X = hierarchical layers + MoCs
+ explicit specification of glues

General architecture of ModHel'X

Executable specifications
of each MoC

Structure
of the model

Execution
engine

Semantic "glues"
between MoCs

Generic
component-oriented
& hierarchical
abstract syntax

(MOF meta-model)

Generic
model of execution

Language for
specifying semantics

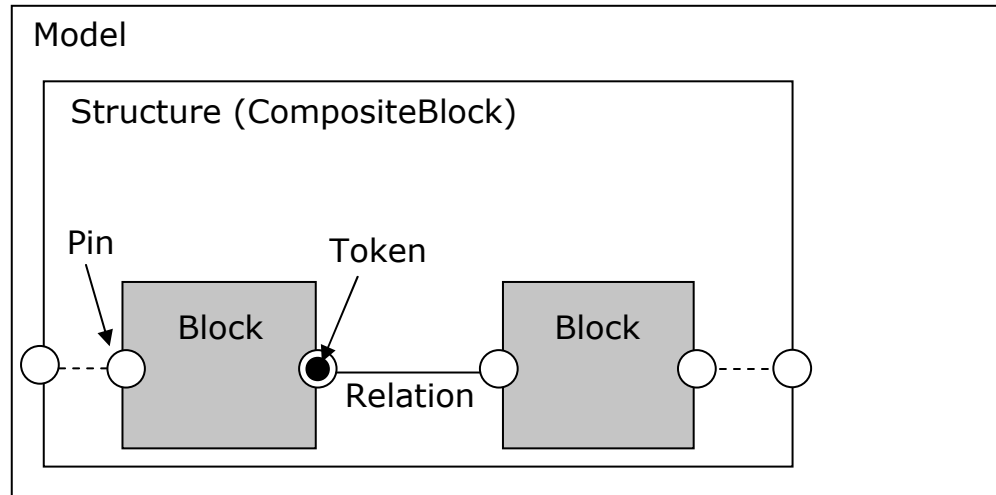

1. Context, existing approaches & motivations
- ▶ 2. ModHel'X: underlying concepts
3. The coffee machine example
4. Discussion & conclusion

1. Context, existing approaches & motivations
- ▶ 2. ModHel'X: underlying concepts
 - Abstract syntax, MoC, hierarchy & glue
 - Model execution
3. The coffee machine example
4. Discussion & conclusion

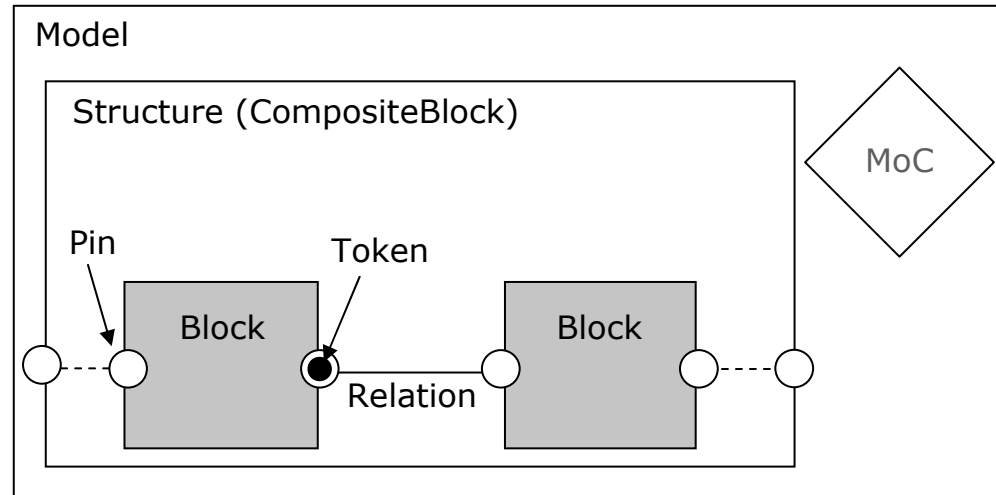

- A few basic concepts: blocks, pins and relations

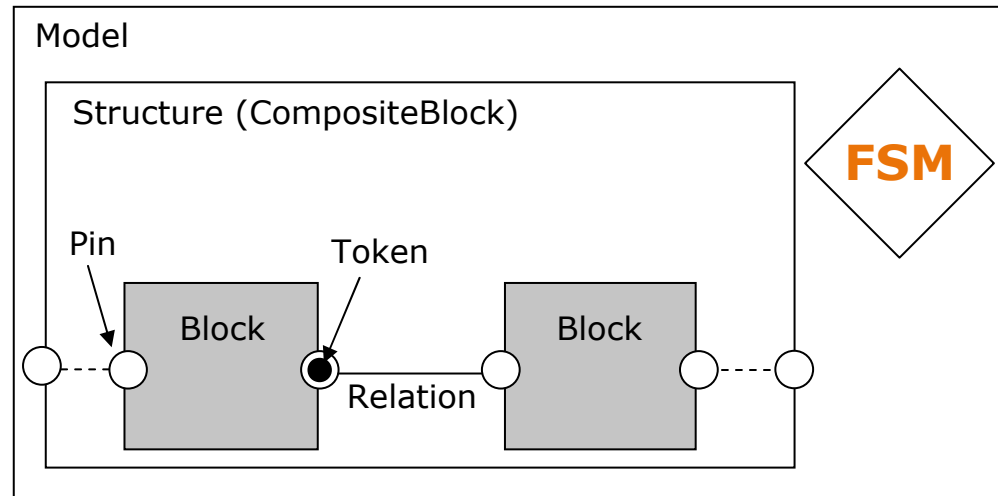

■ Structure of a model

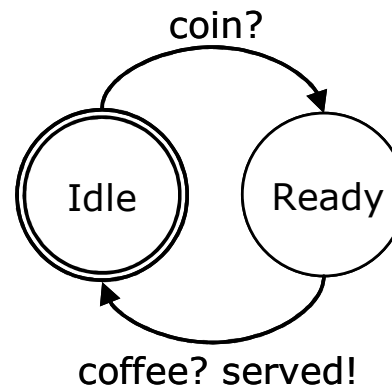

■ Associated semantics: the MoC

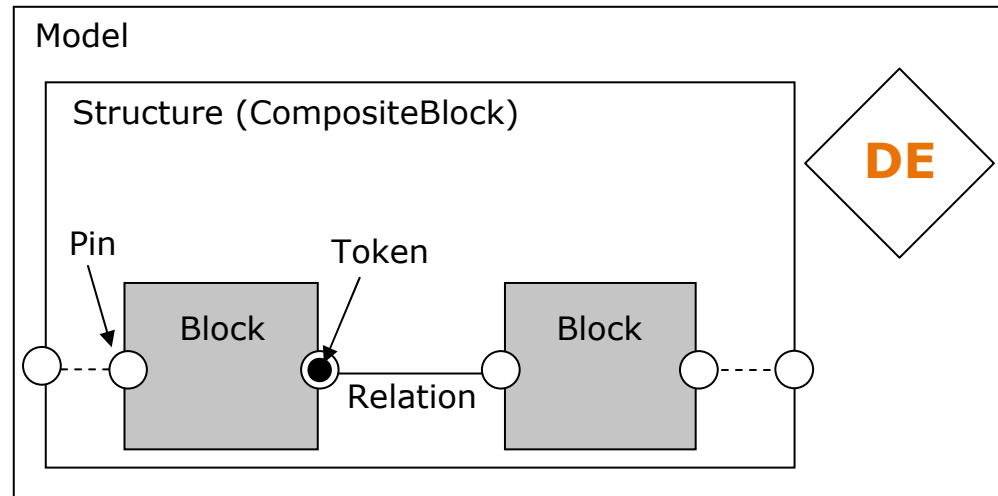

- A given structure, 2 different semantics with 2 different MoCs !

=

- A given structure, 2 different semantics with 2 different MoCs !

=

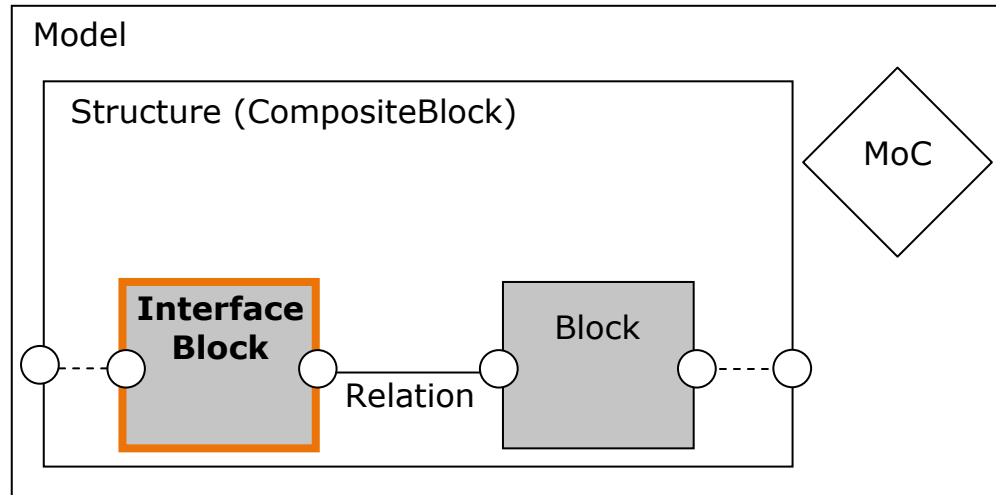

(TheMathworks SimEvents)

- A given structure, 2 different semantics with 2 different MoCs !

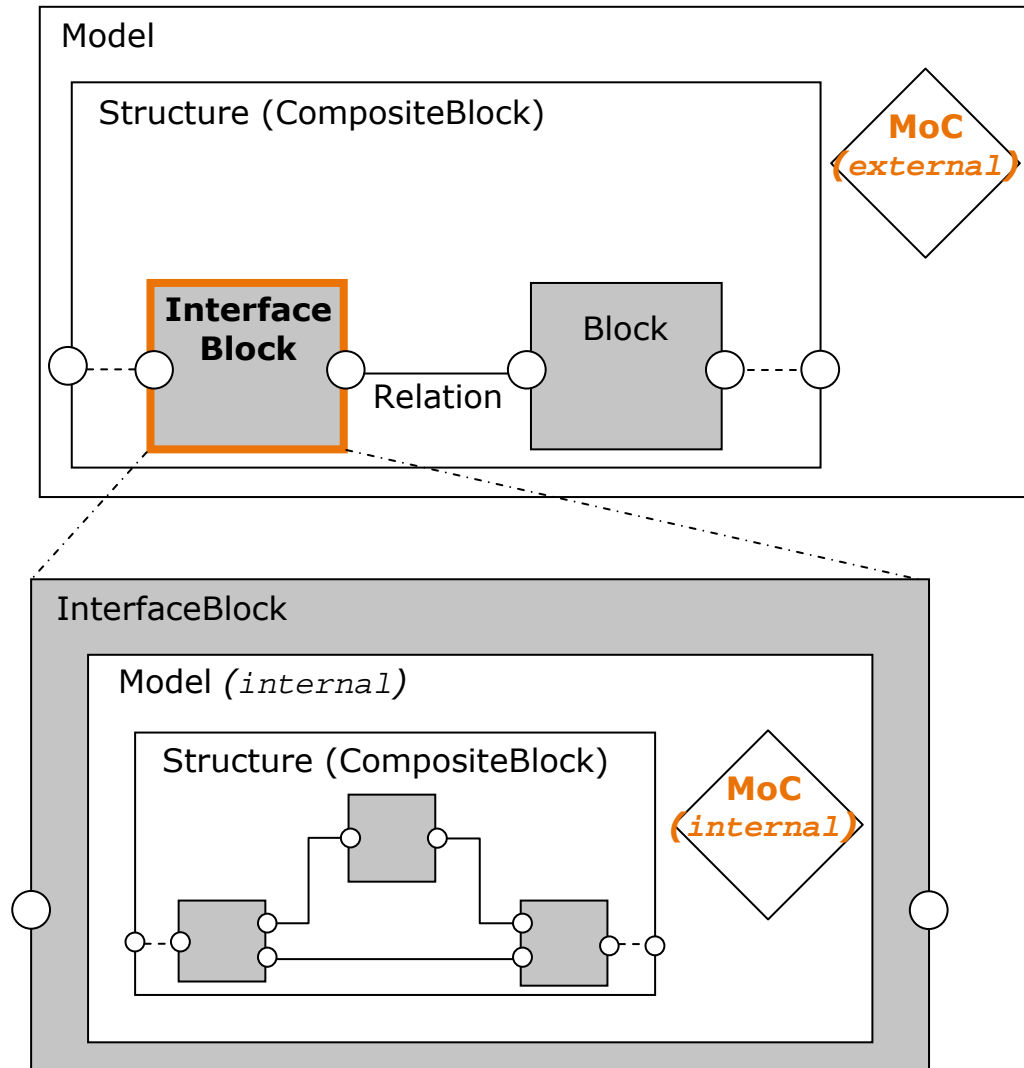

- ▶ **Specialization** of the abstract syntax allowed to
 - Represent **particular concepts** used in certain MoCs
 - **Constrain** the structure of models for particular MoCs

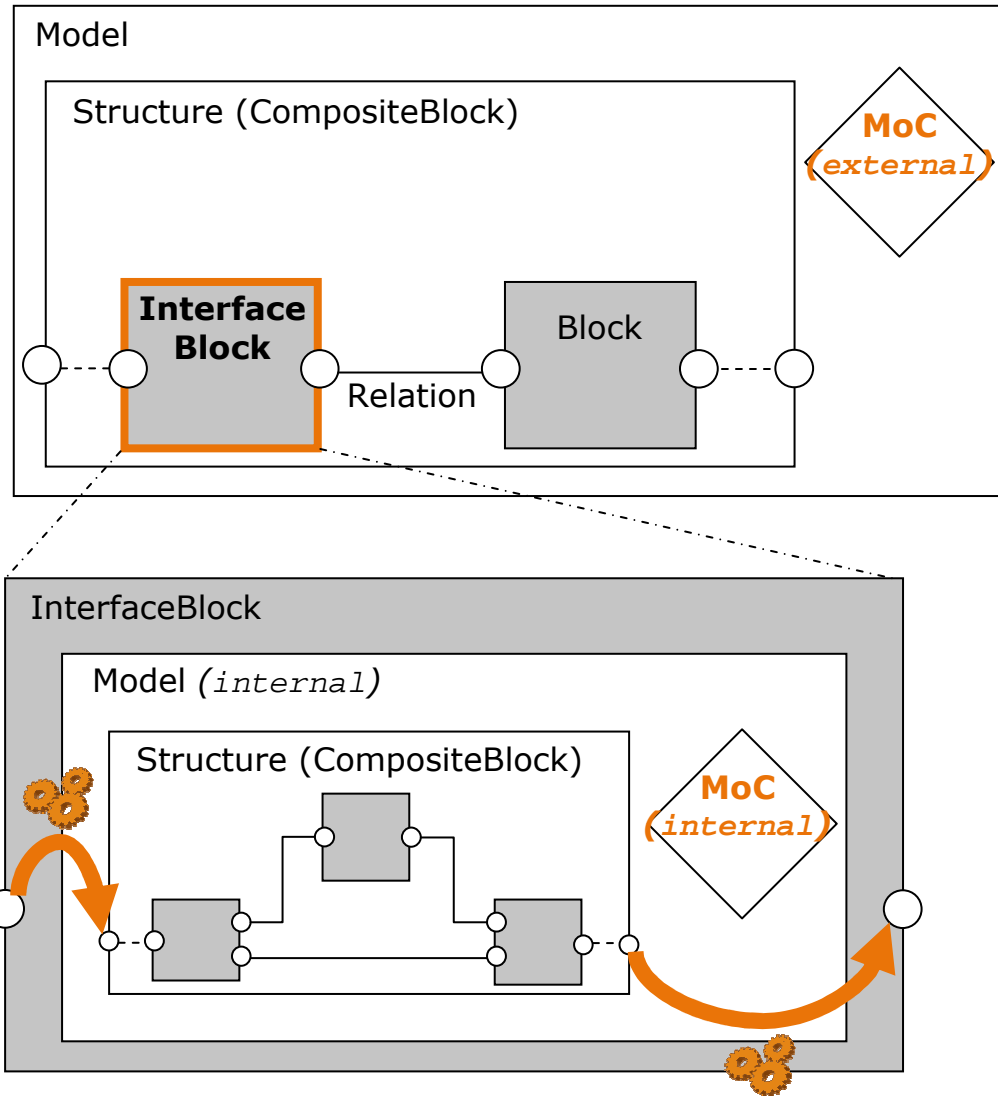

■ Where is heterogeneity?

■ Where is heterogeneity?

■ Where is heterogeneity?

 = Glue

1. Context, existing approaches & motivations
- ▶ 2. ModHel'X: underlying concepts
 - Abstract syntax, MoC, hierarchy & glue
 - Model execution
3. The coffee machine example
4. Discussion & conclusion

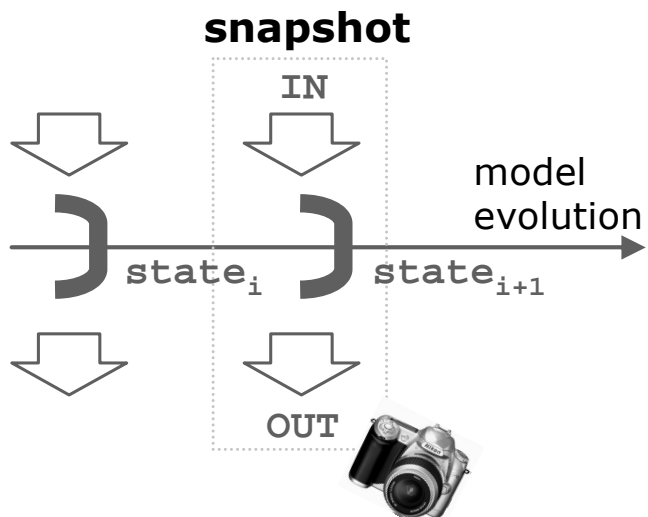

Model execution (observation)

- Model execution = sequence of **snapshots**

Model execution (observation)

- Model execution = sequence of **snapshots**

► When?

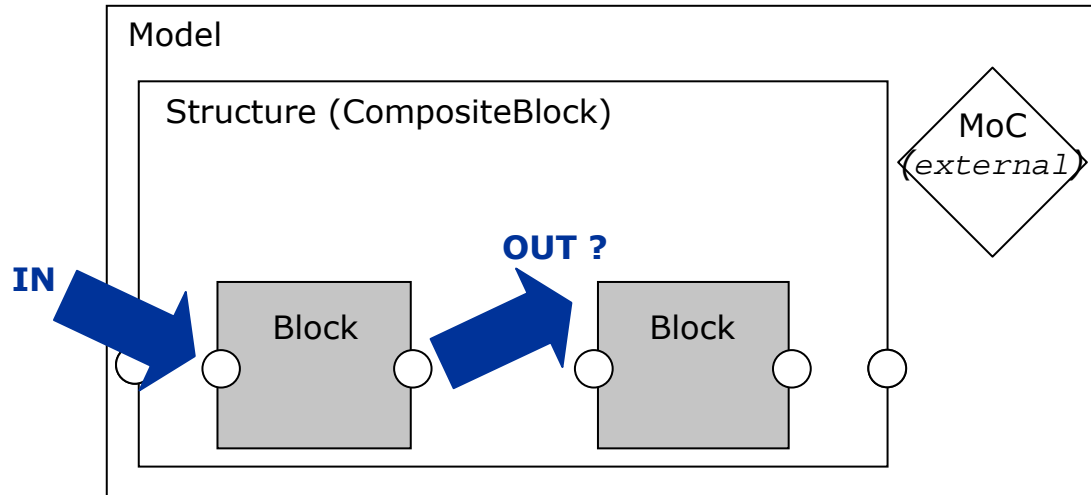

- Regularly
- When the time changes
- When the environment changes
- When the model changes (internally)

Depending on the MoCs involved!
(use of constraints)

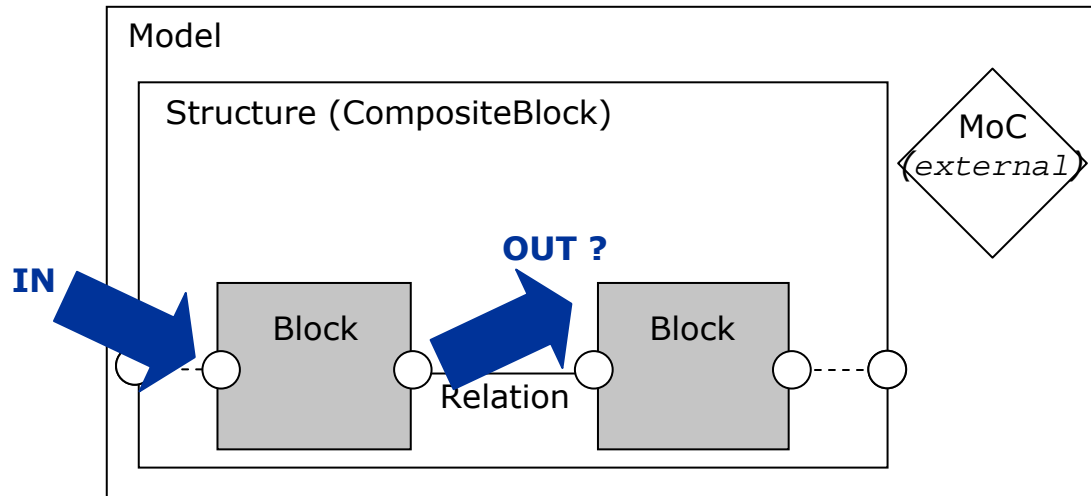

Model execution (observation)

- Snapshot = combination of block updates (observations)

Model execution (observation)

- Snapshot = combination of block **updates (observations)**

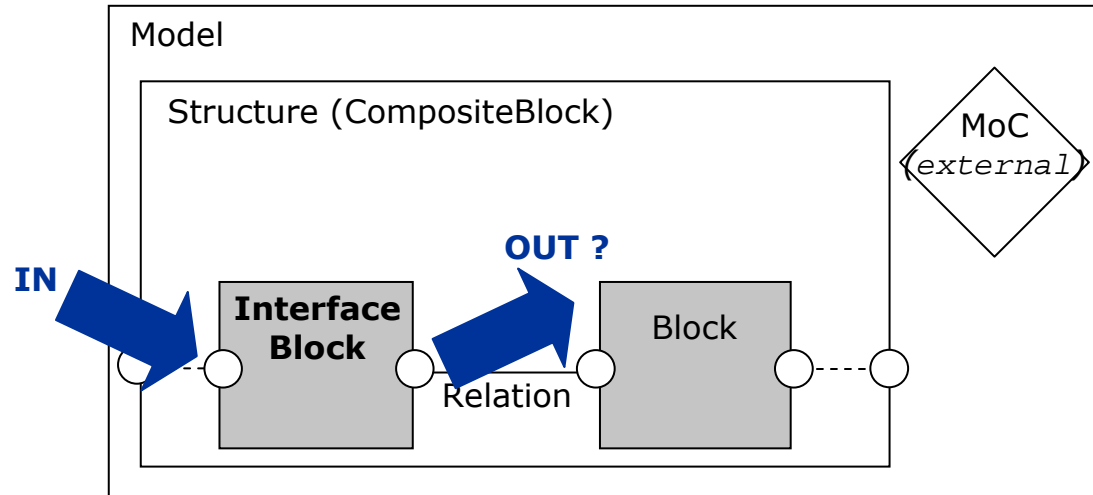

- ▶ In which **order to update** the blocks? (**control and concurrency**)
 - Topological order (e.g. DE)
 - Transitions (e.g. FSM), ...
- ▶ How to **propagate the results** of the updates? (**communication**)
 - Timed events (e.g. DE)
 - Signal flows (e.g. SDF), ...

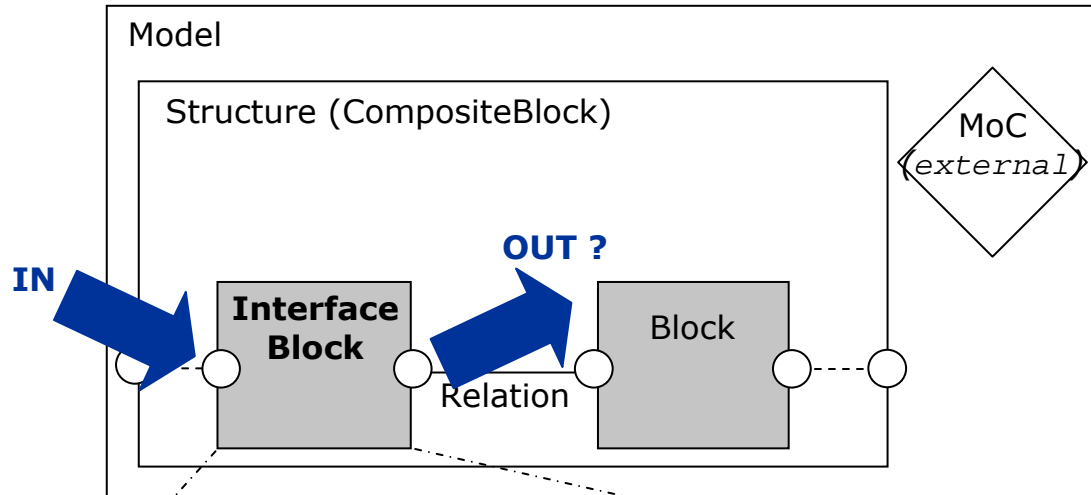

Rules expressed by the MoC
(**scheduling** and **propagation** operations)

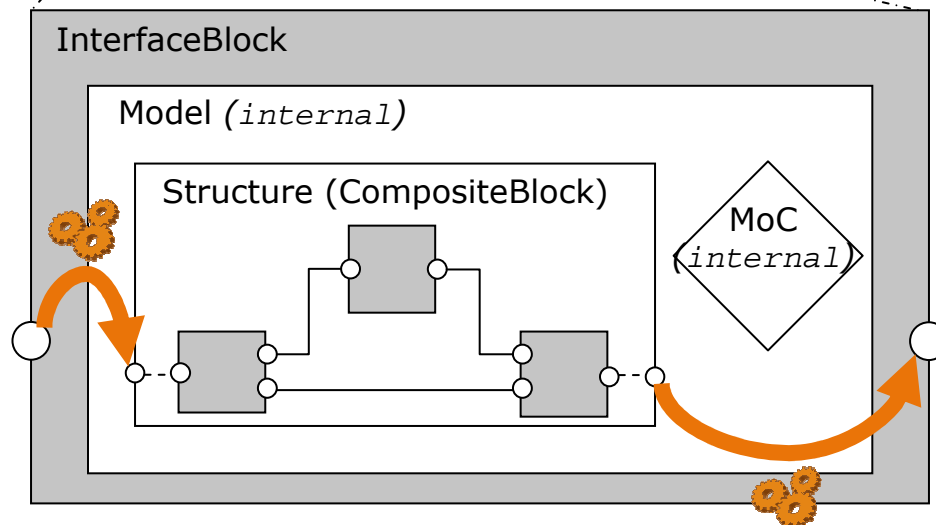

- Heterogeneity = **hierarchy**

- Heterogeneity = **hierarchy**

- ▶ Delegation of the update
- ▶ Adaptation
 - Data
 - Control
 - Time

Glue ()

1. Context, existing approaches & motivations
2. ModHel'X: underlying concepts
- ▶ 3. The coffee machine example
4. Discussion & conclusion

The coffee machine example

The coffee machine example

The coffee machine example

- Semantic adaptation: time “gluing”?

The coffee machine example

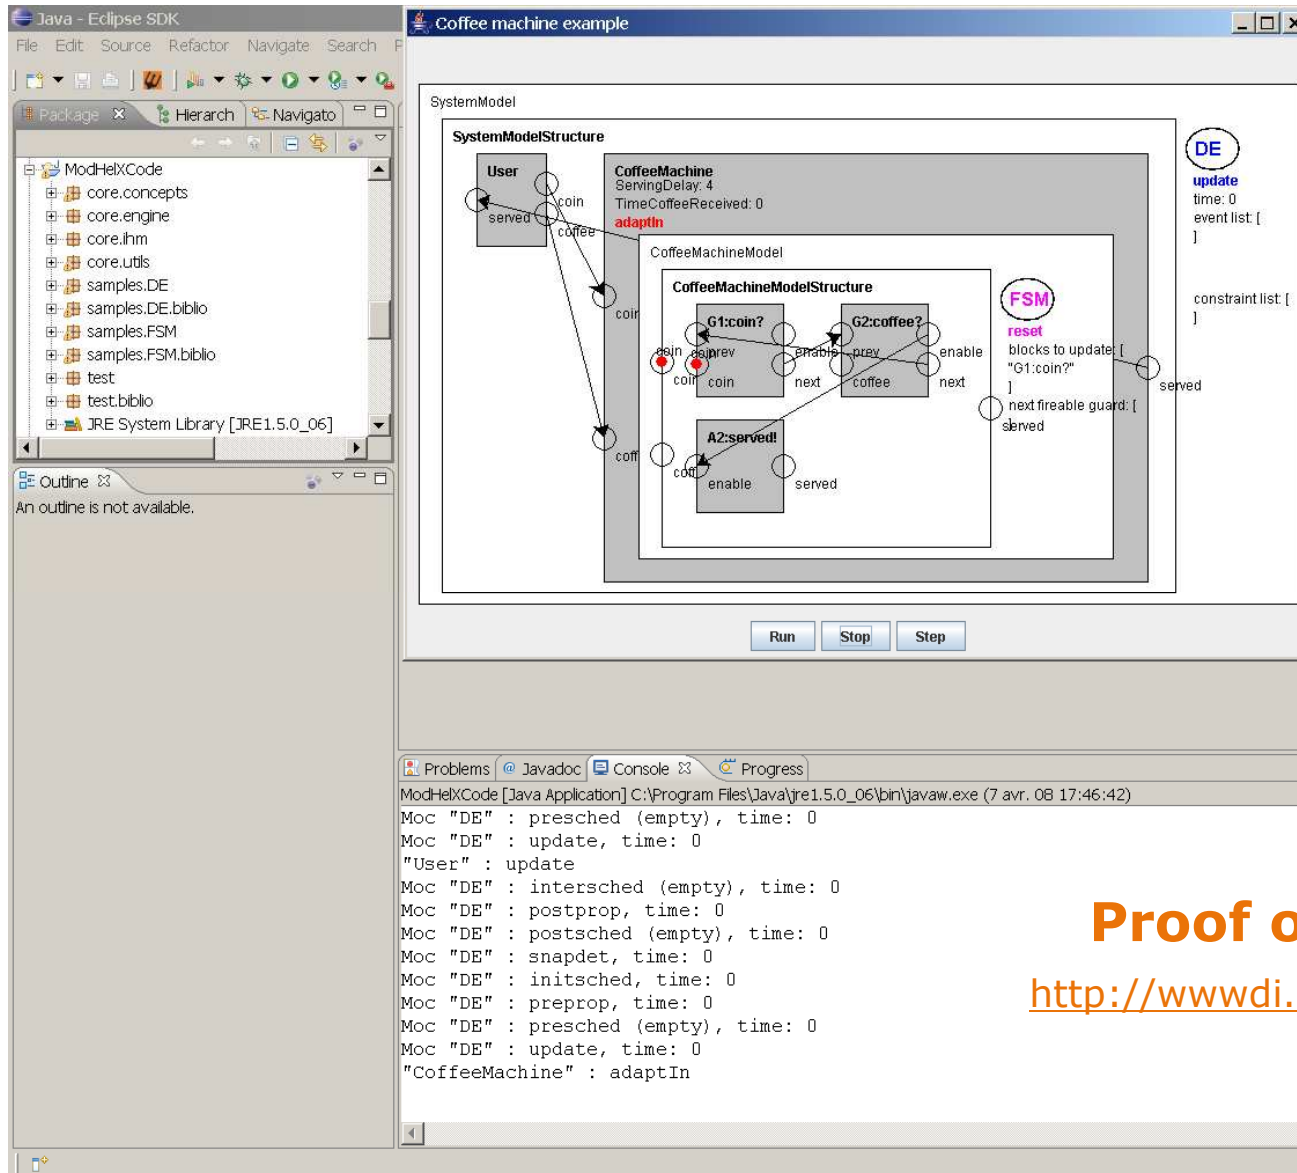

- Semantic adaptation: time “gluing”?
- ▶ in: remove timestamps
- ▶ out: add timestamps
- ➔ which ones?

The coffee machine example

- Semantic adaptation: time “gluing”?
- ▶ in: remove timestamps
- ▶ out: add timestamps
- ➡ which ones?

The screenshot shows the Eclipse IDE with the following components:

- Package Explorer:** Shows a project structure with packages like `core.concepts`, `core.engine`, `core.ihm`, `core.utils`, `samples.DE`, `samples.DE.biblio`, `samples.FSM`, `samples.FSM.biblio`, `test`, and `test.biblio`.
- SystemModel Diagram:**
 - User:** Has a `served` state and sends `coin` and `coffee` messages.
 - CoffeeMachine:** Has attributes `ServingDelay: 4` and `TimeCoffeeReceived: 0`. It receives `adaptIn` and sends `coin` and `coff` messages.
 - CoffeeMachineModel:** Contains `CoffeeMachineModelStructure`.
 - CoffeeMachineModelStructure:** Contains states `G1:coin?` and `G2:coffee?`, and an `FSM` component. Transitions include `prev`, `next`, `enable`, and `coffee`.
 - FSM:** Has a `reset` event and a `served` state. It has a constraint list and a next fireable guard.
 - DE (Discrete Event):** Has an `update` event and an `event list`.
- Console:** Shows the execution log:

```

ModHelXCode [Java Application] C:\Program Files\Java\jre1.5.0_06\bin\javaw.exe (7 avr. 08 17:46:42)
Moc "DE" : presched (empty), time: 0
Moc "DE" : update, time: 0
"User" : update
Moc "DE" : intersched (empty), time: 0
Moc "DE" : postprop, time: 0
Moc "DE" : postsched (empty), time: 0
Moc "DE" : snapdet, time: 0
Moc "DE" : initsched, time: 0
Moc "DE" : preprop, time: 0
Moc "DE" : presched (empty), time: 0
Moc "DE" : update, time: 0
"CoffeeMachine" : adaptIn
      
```

Proof of concept demo

1. Context, existing approaches & motivations
2. ModHel'X: underlying concepts
3. The coffee machine example
- ▶ 4. Discussion & conclusion

■ Use for tests:

Simulation & real-time execution of heterogeneous models

- ▶ Rapid prototyping
- ▶ Execution of test scenarios
- ▶ Generation of traces for analysis, ...

■ Supported MoCs

- ▶ Continuous behaviors: numerical solving (approximation)
- ▶ Cyclic dependencies: fixed point semantics (monotonicity...)
- ▶ Non-determinism: “controlled” non-determinism (pseudo-random functions)

■ How to add support for an additional language in ModHel’X?

- once!
1. An expert of the modeling language describes:
 - The MoC corresponding to the language (structure + semantics)
 - Transformations from the original meta-model of the language to the ModHel’X meta-model
 2. Experts define usual interaction patterns (“glues”) for pairs of MoCs

- **ModHel'X** = an approach to multi-formalism modeling with
 - ▶ A **generic meta-model** for representing heterogeneous models
 - A **specific structure for the explicit and flexible specification of the interactions** between MoCs
 - ▶ A **generic algorithm** for executing heterogeneous models
 - A **fixed frame** for expressing MoCs

- **Work in progress**
 - ▶ **Prototype** based on the Eclipse Modeling Framework (EMF)
 - Several implemented MoCs
 - Working on the Synchronous DataFlow and UML StateCharts MoCs
 - ▶ **Concrete syntax** of our language (OMG ImperativeOCL – QVT)
 - Verbosity
 - Formal semantics

- **Perspectives**
 - ▶ Model based expression of glues
 - ▶ Combination of formal properties
